

Energy and Utilities English

Instructor guide for advanced ESL learners working in energy and utilities

Audience: utility operations staff, energy project managers, grid planners, field supervisors, regulatory affairs teams, renewable-energy developers, customer operations teams, and infrastructure leaders

Focus: An energy and utilities English curriculum for reliability, outages, grid operations, safety, regulatory filings, renewables integration, infrastructure projects, customer communication, and risk reporting.

Designed for advanced ESL learners who already use professional English and need industry-specific terminology, realistic meetings, role-play pressure, careful pushback, and polished workplace outputs.

Teaching stance: this is language and workplace-communication training, not legal, medical, financial, safety, or regulatory advice. Instructors should connect every scenario to the learner's current company policies, local rules, and approved procedures.

Purpose and Course Logic

An energy and utilities English curriculum for reliability, outages, grid operations, safety, regulatory filings, renewables integration, infrastructure projects, customer communication, and risk reporting.

Core language challenge

Advanced learners do not only need vocabulary. They need the ability to ask which standard applies, who owns the decision, what evidence is sufficient, what risk is being accepted, and how to disagree without sounding vague, defensive, or reckless.

Each module trains a realistic workplace pressure point with role-specific terms, decision language, pushback practice, and bounded decision activities learners can apply to their own work.

Course objectives

- Use energy and utilities terminology accurately in meetings, written updates, handoffs, escalations, reviews, and client or stakeholder conversations.
- Turn vague requests into specific questions about evidence, owner, deadline, constraint, risk, and decision rights.
- Push back on unsafe, unsupported, noncompliant, unrealistic, or poorly scoped proposals while preserving professional trust.
- Handle realistic dialogues from the field, including conflict, uncertainty, documentation gaps, customer or stakeholder pressure, and cross-functional disagreement.
- Select language that produces concise workplace outputs: briefing notes, escalation updates, meeting scripts, risk memos, decision records, and follow-up messages.

Instructor Module Plans

Module 1. Grid Reliability and Outage Response (90 minutes)

Explain reliability events with operational precision.

Learners should be able to

- Use these terms accurately: reliability, feeder, restoration, critical customer.
- Explain the workplace tension: Crew safety, fault location, switching, weather, and restoration uncertainty matter.
- Respond professionally when a stakeholder says: Promise restoration within an hour.
- Select the evidence, tradeoff, owner, and decision required for a outage response update.

Customized scenario

Workplace pressure

A feeder outage affects critical customers during peak load.

Promise restoration within an hour.

Crew safety, fault location, switching, weather, and restoration uncertainty matter.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.

- Decision artifact check: select the facts, caveat, owner, and next action that belong in a outage response update.

Module 2. Safety, Field Work, and Switching (90 minutes)

Use field-safety language under pressure.

Learners should be able to

- Use these terms accurately: switching order, lockout, clearance, energize.
- Explain the workplace tension: Lockout, clearance, switching order, and crew confirmation must be complete.
- Respond professionally when a stakeholder says: Proceed to meet the schedule.
- Select the evidence, tradeoff, owner, and decision required for a field safety stop.

Customized scenario

Workplace pressure

A crew is asked to energize equipment before all checks are complete.

Proceed to meet the schedule.

Lockout, clearance, switching order, and crew confirmation must be complete.

Classroom sequence

- Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
- Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
- Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
- Decision artifact check: select the facts, caveat, owner, and next action that belong in a field safety stop.

Module 3. Regulatory Affairs and Rate Cases (90 minutes)

Translate regulatory requirements into business and customer impact.

Learners should be able to

- Use these terms accurately: rate case, tariff, prudence, customer impact.
- Explain the workplace tension: Cost drivers, prudence, customer impact, and regulatory process need careful framing.
- Respond professionally when a stakeholder says: Say rates must rise because costs rose.
- Select the evidence, tradeoff, owner, and decision required for a rate-case narrative.

Customized scenario

Workplace pressure

Leadership wants to simplify a rate-case explanation.

Say rates must rise because costs rose.

Cost drivers, prudence, customer impact, and regulatory process need careful framing.

Classroom sequence

- Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
- Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.

3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a rate-case narrative.

Module 4. Renewables Integration and Interconnection (90 minutes)

Discuss clean-energy goals with grid constraints.

Learners should be able to

- Use these terms accurately: interconnection, capacity, curtailment, queue.
- Explain the workplace tension: Queue position, study results, upgrades, and system reliability affect timing.
- Respond professionally when a stakeholder says: Promise the date to secure the deal.
- Select the evidence, tradeoff, owner, and decision required for a interconnection status note.

Customized scenario

Workplace pressure

A developer wants fast interconnection for a solar project.

Promise the date to secure the deal.

Queue position, study results, upgrades, and system reliability affect timing.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a interconnection status note.

Module 5. Asset Management and Maintenance (90 minutes)

Explain infrastructure risk and investment needs.

Learners should be able to

- Use these terms accurately: asset management, condition assessment, lifecycle cost, failure rate.
- Explain the workplace tension: Asset condition, reliability impact, safety, and lifecycle cost need evaluation.
- Respond professionally when a stakeholder says: Delay replacement for budget reasons.
- Select the evidence, tradeoff, owner, and decision required for a asset-risk business case.

Customized scenario

Workplace pressure

Aging equipment shows rising failure rates.

Delay replacement for budget reasons.

Asset condition, reliability impact, safety, and lifecycle cost need evaluation.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.

2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a asset-risk business case.

Module 6. Emergency Preparedness and Storm Response (90 minutes)

Coordinate crisis communication and resource allocation.

Learners should be able to

- Use these terms accurately: mutual aid, crew staging, restoration priority, emergency response.
- Explain the workplace tension: Mutual aid, crew staging, materials, public communication, and safety messaging need preparation.
- Respond professionally when a stakeholder says: Wait until damage is confirmed.
- Select the evidence, tradeoff, owner, and decision required for a storm readiness brief.

Customized scenario

Workplace pressure

A storm forecast may affect multiple service territories.

Wait until damage is confirmed.

Mutual aid, crew staging, materials, public communication, and safety messaging need preparation.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a storm readiness brief.

Module 7. Customer Programs and Energy Efficiency (90 minutes)

Explain incentives without overpromising savings.

Learners should be able to

- Use these terms accurately: incentive, baseline, demand response, measurement and verification.
- Explain the workplace tension: Eligibility, baseline use, behavior, equipment, and measurement rules affect outcomes.
- Respond professionally when a stakeholder says: Promise the average result.
- Select the evidence, tradeoff, owner, and decision required for a program expectation script.

Customized scenario

Workplace pressure

A customer expects guaranteed savings from an efficiency program.

Promise the average result.

Eligibility, baseline use, behavior, equipment, and measurement rules affect outcomes.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a program expectation script.

Module 8. Executive Reliability and Investment Updates (90 minutes)

Present technical risk to leaders and regulators.

Learners should be able to

- Use these terms accurately: SAIDI, SAIFI, vegetation management, capital plan.
- Explain the workplace tension: SAIDI, SAIFI, asset condition, vegetation, investment, and mitigation all matter.
- Respond professionally when a stakeholder says: Blame weather.
- Select the evidence, tradeoff, owner, and decision required for a reliability executive update.

Customized scenario

Workplace pressure

The executive team asks why reliability metrics worsened.

Blame weather.

SAIDI, SAIFI, asset condition, vegetation, investment, and mitigation all matter.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a reliability executive update.

Nomenclature and Jargon

These are classroom working definitions. Learners should adapt wording to their organization's policies, systems, and local regulatory environment.

Grid Reliability and Outage Response

Term	Working meaning	Collocations	Contrast and workplace line
reliability	In energy and utilities, reliability is a performance or governance dimension that must be protected through defined evidence, thresholds, and accountability. Use it when teams need to explain reliability events with operational precision.	clarify reliability; document reliability	Contrast: reliability should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify reliability and the evidence that supports it.

Term	Working meaning	Collocations	Contrast and workplace line
feeder	In energy and utilities, feeder is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain reliability events with operational precision.	clarify feeder; document feeder	Contrast: feeder should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify feeder and the evidence that supports it.
restoration	In energy and utilities, restoration is a measurable indicator used to quantify performance, exposure, capacity, quality, or change over time. Use it when teams need to explain reliability events with operational precision.	track restoration; explain a change in restoration	Contrast: restoration measures a result or condition; it does not, by itself, prove the cause. Example: Before we act, let us track restoration by segment and explain what changed.
critical customer	In energy and utilities, critical customer is a stakeholder category whose needs, eligibility, experience, or obligations affect the decision. Use it when teams need to explain reliability events with operational precision.	clarify critical customer; document critical customer	Contrast: critical customer should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify critical customer and the evidence that supports it.

Safety, Field Work, and Switching

Term	Working meaning	Collocations	Contrast and workplace line
switching order	In energy and utilities, switching order is a formal intake or routing mechanism that starts work, seeks a decision, or transfers responsibility. Use it when teams need to use field-safety language under pressure.	clarify switching order; document switching order	Contrast: switching order should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify switching order and the evidence that supports it.
lockout	In energy and utilities, lockout is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to use field-safety language under pressure.	clarify lockout; document lockout	Contrast: lockout should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify lockout and the evidence that supports it.
clearance	In energy and utilities, clearance is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to use field-safety language under pressure.	clarify clearance; document clearance	Contrast: clearance should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify clearance and the evidence that supports it.
energize	In energy and utilities, energize is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to use field-safety language under pressure.	clarify energize; document energize	Contrast: energize should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify energize and the evidence that supports it.

Regulatory Affairs and Rate Cases

Term	Working meaning	Collocations	Contrast and workplace line
rate case	In energy and utilities, rate case is a measurable indicator used to quantify performance, exposure, capacity, quality, or change over time. Use it when teams need to translate regulatory requirements into business and customer impact.	track rate case; explain a change in rate case	Contrast: rate case measures a result or condition; it does not, by itself, prove the cause. Example: Before we act, let us track rate case by segment and explain what changed.

Term	Working meaning	Collocations	Contrast and workplace line
tariff	In energy and utilities, tariff is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to translate regulatory requirements into business and customer impact.	clarify tariff; document tariff	Contrast: tariff should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify tariff and the evidence that supports it.
prudence	In energy and utilities, prudence is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to translate regulatory requirements into business and customer impact.	clarify prudence; document prudence	Contrast: prudence should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify prudence and the evidence that supports it.
customer impact	In energy and utilities, customer impact is a stakeholder category whose needs, eligibility, experience, or obligations affect the decision. Use it when teams need to translate regulatory requirements into business and customer impact.	clarify customer impact; document customer impact	Contrast: customer impact should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify customer impact and the evidence that supports it.

Renewables Integration and Interconnection

Term	Working meaning	Collocations	Contrast and workplace line
interconnection	In energy and utilities, interconnection is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss clean-energy goals with grid constraints.	clarify interconnection; document interconnection	Contrast: interconnection should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify interconnection and the evidence that supports it.
capacity	Available people, assets, time, space, or system throughput for a given workload.	clarify capacity; document capacity	Contrast: capacity should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify capacity and the evidence that supports it.
curtailment	In energy and utilities, curtailment is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss clean-energy goals with grid constraints.	clarify curtailment; document curtailment	Contrast: curtailment should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify curtailment and the evidence that supports it.
queue	In energy and utilities, queue is an operational constraint that affects how much work can be completed, by whom, and by when. Use it when teams need to discuss clean-energy goals with grid constraints.	clarify queue; document queue	Contrast: queue should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify queue and the evidence that supports it.

Asset Management and Maintenance

Term	Working meaning	Collocations	Contrast and workplace line
asset management	In energy and utilities, asset management is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain infrastructure risk and investment needs.	clarify asset management; document asset management	Contrast: asset management should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify asset management and the evidence that supports it.

Term	Working meaning	Collocations	Contrast and workplace line
condition assessment	In energy and utilities, condition assessment is a structured examination of evidence, process, or results used to reach a defensible conclusion. Use it when teams need to explain infrastructure risk and investment needs.	conduct a condition assessment; document the condition assessment	Contrast: condition assessment is a structured examination of evidence; it is not a conclusion reached before the evidence is checked. Example: The team will conduct a condition assessment before it recommends a corrective action.
lifecycle cost	In energy and utilities, lifecycle cost is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain infrastructure risk and investment needs.	clarify lifecycle cost; document lifecycle cost	Contrast: lifecycle cost should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify lifecycle cost and the evidence that supports it.
failure rate	In energy and utilities, failure rate is a measurable indicator used to quantify performance, exposure, capacity, quality, or change over time. Use it when teams need to explain infrastructure risk and investment needs.	track failure rate; explain a change in failure rate	Contrast: failure rate measures a result or condition; it does not, by itself, prove the cause. Example: Before we act, let us track failure rate by segment and explain what changed.

Emergency Preparedness and Storm Response

Term	Working meaning	Collocations	Contrast and workplace line
mutual aid	In energy and utilities, mutual aid is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to coordinate crisis communication and resource allocation.	clarify mutual aid; document mutual aid	Contrast: mutual aid should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify mutual aid and the evidence that supports it.
crew staging	In energy and utilities, crew staging is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to coordinate crisis communication and resource allocation.	clarify crew staging; document crew staging	Contrast: crew staging should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify crew staging and the evidence that supports it.
restoration priority	In energy and utilities, restoration priority is a measurable indicator used to quantify performance, exposure, capacity, quality, or change over time. Use it when teams need to coordinate crisis communication and resource allocation.	track restoration priority; explain a change in restoration priority	Contrast: restoration priority measures a result or condition; it does not, by itself, prove the cause. Example: Before we act, let us track restoration priority by segment and explain what changed.
emergency response	In energy and utilities, emergency response is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to coordinate crisis communication and resource allocation.	clarify emergency response; document emergency response	Contrast: emergency response should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify emergency response and the evidence that supports it.

Customer Programs and Energy Efficiency

Term	Working meaning	Collocations	Contrast and workplace line
incentive	In energy and utilities, incentive is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain incentives without overpromising savings.	clarify incentive; document incentive	Contrast: incentive should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify incentive and the evidence that supports it.
baseline	In energy and utilities, baseline is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain incentives without overpromising savings.	clarify baseline; document baseline	Contrast: baseline should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify baseline and the evidence that supports it.
demand response	In energy and utilities, demand response is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain incentives without overpromising savings.	clarify demand response; document demand response	Contrast: demand response should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify demand response and the evidence that supports it.
measurement and verification	In energy and utilities, measurement and verification is a repeatable control mechanism used to prevent, detect, or confirm conditions before work proceeds. Use it when teams need to explain incentives without overpromising savings.	clarify measurement and verification; document measurement and verification	Contrast: measurement and verification should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify measurement and verification and the evidence that supports it.

Executive Reliability and Investment Updates

Term	Working meaning	Collocations	Contrast and workplace line
SAIDI	In energy and utilities, SAIDI is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to present technical risk to leaders and regulators.	clarify SAIDI; document SAIDI	Contrast: SAIDI should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify SAIDI and the evidence that supports it.
SAIFI	In energy and utilities, SAIFI is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to present technical risk to leaders and regulators.	clarify SAIFI; document SAIFI	Contrast: SAIFI should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify SAIFI and the evidence that supports it.
vegetation management	In energy and utilities, vegetation management is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to present technical risk to leaders and regulators.	clarify vegetation management; document vegetation management	Contrast: vegetation management should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify vegetation management and the evidence that supports it.
capital plan	In energy and utilities, capital plan is a structured course of action that assigns priorities, sequencing, assumptions, and responsible roles. Use it when teams need to present technical risk to leaders and regulators.	align on the capital plan; revise the capital plan	Contrast: capital plan sets an intended course of action; it is not proof that the work is feasible or approved. Example: Before we revise the capital plan, we need to test the dependency and resource assumptions.

Industry-Specific Meeting Moves

Situation	Useful language
Grid Reliability and Outage Response	Before we commit, I want to confirm reliability, feeder, the owner, and the evidence behind the decision. If crew safety, fault location, switching, weather, and restoration uncertainty matter., I recommend we document the risk and agree on the next step.
Safety, Field Work, and Switching	Before we commit, I want to confirm switching order, lockout, the owner, and the evidence behind the decision. If lockout, clearance, switching order, and crew confirmation must be complete., I recommend we document the risk and agree on the next step.
Regulatory Affairs and Rate Cases	Before we commit, I want to confirm rate case, tariff, the owner, and the evidence behind the decision. If cost drivers, prudence, customer impact, and regulatory process need careful framing., I recommend we document the risk and agree on the next step.
Renewables Integration and Interconnection	Before we commit, I want to confirm interconnection, capacity, the owner, and the evidence behind the decision. If queue position, study results, upgrades, and system reliability affect timing., I recommend we document the risk and agree on the next step.
Asset Management and Maintenance	Before we commit, I want to confirm asset management, condition assessment, the owner, and the evidence behind the decision. If asset condition, reliability impact, safety, and lifecycle cost need evaluation., I recommend we document the risk and agree on the next step.
Emergency Preparedness and Storm Response	Before we commit, I want to confirm mutual aid, crew staging, the owner, and the evidence behind the decision. If mutual aid, crew staging, materials, public communication, and safety messaging need preparation., I recommend we document the risk and agree on the next step.
Customer Programs and Energy Efficiency	Before we commit, I want to confirm incentive, baseline, the owner, and the evidence behind the decision. If eligibility, baseline use, behavior, equipment, and measurement rules affect outcomes., I recommend we document the risk and agree on the next step.
Executive Reliability and Investment Updates	Before we commit, I want to confirm SAIDI, SAIFI, the owner, and the evidence behind the decision. If saidi, saifi, asset condition, vegetation, investment, and mitigation all matter., I recommend we document the risk and agree on the next step.

High-pressure pushback frames

- I understand the urgency. The risk is that we move faster than the evidence or process supports.
- I am not blocking the goal. I am naming the condition we need before the decision is safe and credible.
- If we accept this risk, we should name the owner, document the assumption, and define the trigger for escalation.
- That may be possible, but not under the current scope, timeline, or approval path.
- Let's separate what we know, what we assume, and what still needs confirmation.

Assessment and Coaching

Performance rubric

Skill	Developing	Proficient	Strong
Terminology	Recognizes terms but uses them loosely.	Uses field terms accurately in context.	Defines terms, connects them to evidence, and explains decision impact.
Pushback	Disagrees vaguely or avoids disagreement.	Names concern with evidence and next step.	Balances urgency, relationship, risk, owner, and decision rights.
Scenario judgment	Focuses on one stakeholder's preference.	Identifies constraint, risk, and process.	Guides the group toward a documented, realistic decision.
Decision communication	Selects language without linking it to the decision.	Chooses language that names facts, owner, and next step.	Distinguishes evidence, tradeoff, authority, and escalation in a decision-ready response.

Source orientation

- Utility operating procedures and safety manuals.
- Public utility commission requirements and tariffs.
- Emergency response and customer communication protocols.
- The learner's own company policies, SOPs, contracts, systems, templates, and approved communication standards.
