

Manufacturing English

Instructor guide for advanced ESL learners working in manufacturing

Audience: plant managers, production supervisors, quality engineers, maintenance teams, industrial engineers, safety leads, supply planners, and manufacturing-adjacent professionals

Focus: A manufacturing English curriculum for production meetings, line problems, lean improvement, defects, maintenance, safety, supplier quality, shift handoffs, and root-cause communication.

Designed for advanced ESL learners who already use professional English and need industry-specific terminology, realistic meetings, role-play pressure, careful pushback, and polished workplace outputs.

Teaching stance: this is language and workplace-communication training, not legal, medical, financial, safety, or regulatory advice. Instructors should connect every scenario to the learner's current company policies, local rules, and approved procedures.

Purpose and Course Logic

A manufacturing English curriculum for production meetings, line problems, lean improvement, defects, maintenance, safety, supplier quality, shift handoffs, and root-cause communication.

Core language challenge

Advanced learners do not only need vocabulary. They need the ability to ask which standard applies, who owns the decision, what evidence is sufficient, what risk is being accepted, and how to disagree without sounding vague, defensive, or reckless.

Each module trains a realistic workplace pressure point with role-specific terms, decision language, pushback practice, and bounded decision activities learners can apply to their own work.

Course objectives

- Use manufacturing terminology accurately in meetings, written updates, handoffs, escalations, reviews, and client or stakeholder conversations.
- Turn vague requests into specific questions about evidence, owner, deadline, constraint, risk, and decision rights.
- Push back on unsafe, unsupported, noncompliant, unrealistic, or poorly scoped proposals while preserving professional trust.
- Handle realistic dialogues from the field, including conflict, uncertainty, documentation gaps, customer or stakeholder pressure, and cross-functional disagreement.
- Select language that produces concise workplace outputs: briefing notes, escalation updates, meeting scripts, risk memos, decision records, and follow-up messages.

Instructor Module Plans

Module 1. Production Flow and Daily Management (90 minutes)

Report line status with throughput, downtime, and constraint language.

Learners should be able to

- Use these terms accurately: throughput, cycle time, constraint, downtime.
- Explain the workplace tension: The constraint may be material availability, changeover time, staffing, or equipment reliability.
- Respond professionally when a stakeholder says: Ask operators to work faster.
- Select the evidence, tradeoff, owner, and decision required for a daily production update.

Customized scenario

Workplace pressure

A line misses target for the third shift in a row.

Ask operators to work faster.

The constraint may be material availability, changeover time, staffing, or equipment reliability.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.

3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a daily production update.

Module 2. Lean, Waste, and Continuous Improvement (90 minutes)

Discuss waste reduction without blaming people.

Learners should be able to

- Use these terms accurately: kaizen, standard work, waste, value stream.
- Explain the workplace tension: Process design, layout, standard work, and visual management need review.
- Respond professionally when a stakeholder says: Tell employees to be more efficient.
- Select the evidence, tradeoff, owner, and decision required for a lean improvement proposal.

Customized scenario

Workplace pressure

A kaizen event identifies excess movement and waiting.

Tell employees to be more efficient.

Process design, layout, standard work, and visual management need review.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a lean improvement proposal.

Module 3. Defects, Scrap, and Rework (90 minutes)

Explain defect trends and containment actions clearly.

Learners should be able to

- Use these terms accurately: defect, scrap, rework, containment.
- Explain the workplace tension: Containment, defect mode, inspection plan, and customer impact must be defined.
- Respond professionally when a stakeholder says: Ship the acceptable units and watch the trend.
- Select the evidence, tradeoff, owner, and decision required for a defect containment brief.

Customized scenario

Workplace pressure

Scrap has increased after a tooling change.

Ship the acceptable units and watch the trend.

Containment, defect mode, inspection plan, and customer impact must be defined.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.

2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a defect containment brief.

Module 4. Root Cause and Corrective Action (90 minutes)

Move from symptom language to evidence-based cause analysis.

Learners should be able to

- Use these terms accurately: root cause, 5 Whys, fishbone, 8D.
- Explain the workplace tension: Root cause must be supported by data, not assumed from the visible failure.
- Respond professionally when a stakeholder says: Say the operator missed a step.
- Select the evidence, tradeoff, owner, and decision required for a 8D problem statement.

Customized scenario

Workplace pressure

A customer returns parts for fit issues.

Say the operator missed a step.

Root cause must be supported by data, not assumed from the visible failure.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a 8D problem statement.

Module 5. Maintenance, Reliability, and Changeover (90 minutes)

Discuss equipment risk and maintenance tradeoffs.

Learners should be able to

- Use these terms accurately: preventive maintenance, MTBF, changeover, spare parts.
- Explain the workplace tension: Unplanned downtime, safety risk, spare parts, and preventive maintenance need balancing.
- Respond professionally when a stakeholder says: Delay maintenance until the order is complete.
- Select the evidence, tradeoff, owner, and decision required for a maintenance risk escalation.

Customized scenario

Workplace pressure

A critical machine keeps failing during peak demand.

Delay maintenance until the order is complete.

Unplanned downtime, safety risk, spare parts, and preventive maintenance need balancing.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a maintenance risk escalation.

Module 6. EHS and Safety Communication (90 minutes)

Stop unsafe work with direct but professional language.

Learners should be able to

- Use these terms accurately: EHS, lockout/tagout, near miss, stop work.
- Explain the workplace tension: Safety controls, lockout/tagout, and incident risk override schedule pressure.
- Respond professionally when a stakeholder says: Finish the run and fix the guard later.
- Select the evidence, tradeoff, owner, and decision required for a safety stop-work script.

Customized scenario

Workplace pressure

A supervisor sees bypassed guarding during a rush order.

Finish the run and fix the guard later.

Safety controls, lockout/tagout, and incident risk override schedule pressure.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a safety stop-work script.

Module 7. Supplier Quality and Incoming Materials (90 minutes)

Communicate supplier problems with evidence and business impact.

Learners should be able to

- Use these terms accurately: supplier quality, incoming inspection, specification, deviation.
- Explain the workplace tension: Specification, deviation approval, alternate supply, and customer risk must be assessed.
- Respond professionally when a stakeholder says: Use it because the supplier says it is fine.
- Select the evidence, tradeoff, owner, and decision required for a supplier deviation request.

Customized scenario

Workplace pressure

Incoming material fails inspection before a major build.

Use it because the supplier says it is fine.

Specification, deviation approval, alternate supply, and customer risk must be assessed.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a supplier deviation request.

Module 8. Shift Handoffs and Escalation (90 minutes)

Create clean shift-to-shift continuity.

Learners should be able to

- Use these terms accurately: handoff, andon, escalation, owner.
- Explain the workplace tension: Handoff needs status, actions taken, risk, owner, and escalation path.
- Respond professionally when a stakeholder says: Let day shift figure it out.
- Select the evidence, tradeoff, owner, and decision required for a shift handoff note.

Customized scenario**Workplace pressure**

The night shift leaves an unresolved process alarm.

Let day shift figure it out.

Handoff needs status, actions taken, risk, owner, and escalation path.

Classroom sequence

1. Terminology selection: distinguish the term that names the decision variable from three plausible alternatives.
2. Risk triage: select the stakeholder, decision, evidence gap, operating constraint, and cost of being wrong from a bounded scenario set.
3. Pushback ladder: choose the strongest sequence from clarification to evidence-based objection to consequence to decision request.
4. Decision artifact check: select the facts, caveat, owner, and next action that belong in a shift handoff note.

Nomenclature and Jargon

These are classroom working definitions. Learners should adapt wording to their organization's policies, systems, and local regulatory environment.

Production Flow and Daily Management

Term	Working meaning	Collocations	Contrast and workplace line
throughput	Amount of work, patients, goods, cases, or transactions completed in a period of time.	clarify throughput; document throughput	Contrast: throughput should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify throughput and the evidence that supports it.
cycle time	In manufacturing, cycle time is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to report line status with throughput, downtime, and constraint language.	clarify cycle time; document cycle time	Contrast: cycle time should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify cycle time and the evidence that supports it.
constraint	In manufacturing, constraint is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to report line status with throughput, downtime, and constraint language.	clarify constraint; document constraint	Contrast: constraint should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify constraint and the evidence that supports it.
downtime	In manufacturing, downtime is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to report line status with throughput, downtime, and constraint language.	clarify downtime; document downtime	Contrast: downtime should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify downtime and the evidence that supports it.

Lean, Waste, and Continuous Improvement

Term	Working meaning	Collocations	Contrast and workplace line
kaizen	In manufacturing, kaizen is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss waste reduction without blaming people.	clarify kaizen; document kaizen	Contrast: kaizen should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify kaizen and the evidence that supports it.
standard work	In manufacturing, standard work is an approved rule or decision framework that sets what is permitted, required, or acceptable. Use it when teams need to discuss waste reduction without blaming people.	apply the standard work; comply with the standard work	Contrast: standard work is an approved rule or threshold, not an informal preference. Example: Please confirm which standard work applies before we commit the team.
waste	In manufacturing, waste is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss waste reduction without blaming people.	clarify waste; document waste	Contrast: waste should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify waste and the evidence that supports it.
value stream	In manufacturing, value stream is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss waste reduction without blaming people.	clarify value stream; document value stream	Contrast: value stream should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify value stream and the evidence that supports it.

Defects, Scrap, and Rework

Term	Working meaning	Collocations	Contrast and workplace line
defect	Failure, flaw, nonconformance, or error that prevents an output from meeting requirements.	assess defect; mitigate defect	Contrast: defect identifies a possible or current exposure; it is not the same as accepting that exposure. Example: We need to assess defect, name the owner, and agree on the trigger for escalation.
scrap	In manufacturing, scrap is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain defect trends and containment actions clearly.	clarify scrap; document scrap	Contrast: scrap should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify scrap and the evidence that supports it.
rework	In manufacturing, rework is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain defect trends and containment actions clearly.	clarify rework; document rework	Contrast: rework should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify rework and the evidence that supports it.
containment	In manufacturing, containment is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to explain defect trends and containment actions clearly.	clarify containment; document containment	Contrast: containment should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify containment and the evidence that supports it.

Root Cause and Corrective Action

Term	Working meaning	Collocations	Contrast and workplace line
root cause	Underlying reason a problem occurred, not merely the visible symptom.	clarify root cause; document root cause	Contrast: root cause should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify root cause and the evidence that supports it.
5 Whys	Root-cause method that repeatedly asks why a problem occurred until the team reaches a controllable underlying cause.	clarify 5 Whys; document 5 Whys	Contrast: 5 Whys should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify 5 Whys and the evidence that supports it.
fishbone	In manufacturing, fishbone is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to move from symptom language to evidence-based cause analysis.	clarify fishbone; document fishbone	Contrast: fishbone should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify fishbone and the evidence that supports it.
8D	Eight-discipline problem-solving report used to contain a problem, identify root cause, implement corrective action, and prevent recurrence.	clarify 8D; document 8D	Contrast: 8D should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify 8D and the evidence that supports it.

Maintenance, Reliability, and Changeover

Term	Working meaning	Collocations	Contrast and workplace line
preventive maintenance	In manufacturing, preventive maintenance is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss equipment risk and maintenance tradeoffs.	clarify preventive maintenance; document preventive maintenance	Contrast: preventive maintenance should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify preventive maintenance and the evidence that supports it.
MTBF	In manufacturing, MTBF is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss equipment risk and maintenance tradeoffs.	clarify MTBF; document MTBF	Contrast: MTBF should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify MTBF and the evidence that supports it.
changeover	In manufacturing, changeover is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss equipment risk and maintenance tradeoffs.	clarify changeover; document changeover	Contrast: changeover should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify changeover and the evidence that supports it.
spare parts	In manufacturing, spare parts is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to discuss equipment risk and maintenance tradeoffs.	clarify spare parts; document spare parts	Contrast: spare parts should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify spare parts and the evidence that supports it.

EHS and Safety Communication

Term	Working meaning	Collocations	Contrast and workplace line
EHS	In manufacturing, EHS is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to stop unsafe work with direct but professional language.	clarify EHS; document EHS	Contrast: EHS should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify EHS and the evidence that supports it.
lockout/tagout	In manufacturing, lockout/tagout is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to stop unsafe work with direct but professional language.	clarify lockout/tagout; document lockout/tagout	Contrast: lockout/tagout should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify lockout/tagout and the evidence that supports it.
near miss	In manufacturing, near miss is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to stop unsafe work with direct but professional language.	clarify near miss; document near miss	Contrast: near miss should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify near miss and the evidence that supports it.
stop work	In manufacturing, stop work is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to stop unsafe work with direct but professional language.	clarify stop work; document stop work	Contrast: stop work should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify stop work and the evidence that supports it.

Supplier Quality and Incoming Materials

Term	Working meaning	Collocations	Contrast and workplace line
supplier quality	In manufacturing, supplier quality is a stakeholder category whose needs, eligibility, experience, or obligations affect the decision. Use it when teams need to communicate supplier problems with evidence and business impact.	clarify supplier quality; document supplier quality	Contrast: supplier quality should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify supplier quality and the evidence that supports it.
incoming inspection	In manufacturing, incoming inspection is a structured examination of evidence, process, or results used to reach a defensible conclusion. Use it when teams need to communicate supplier problems with evidence and business impact.	conduct a incoming inspection; document the incoming inspection	Contrast: incoming inspection is a structured examination of evidence; it is not a conclusion reached before the evidence is checked. Example: The team will conduct a incoming inspection before it recommends a corrective action.
specification	In manufacturing, specification is a controlled description of how a product, service, system, or built asset is intended to work. Use it when teams need to communicate supplier problems with evidence and business impact.	clarify specification; document specification	Contrast: specification should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify specification and the evidence that supports it.
deviation	In manufacturing, deviation is a condition or event that can create harm, loss, noncompliance, delay, or unacceptable performance. Use it when teams need to communicate supplier problems with evidence and business impact.	assess deviation; mitigate deviation	Contrast: deviation identifies a possible or current exposure; it is not the same as accepting that exposure. Example: We need to assess deviation, name the owner, and agree on the trigger for escalation.

Shift Handoffs and Escalation

Term	Working meaning	Collocations	Contrast and workplace line
handoff	Transfer of work, responsibility, information, or risk from one person or team to another.	clarify handoff; document handoff	Contrast: handoff should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify handoff and the evidence that supports it.
andon	In manufacturing, andon is a field-specific concept used to locate the relevant fact, boundary, or decision variable. Use it when teams need to create clean shift-to-shift continuity.	clarify andon; document andon	Contrast: andon should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify andon and the evidence that supports it.
escalation	Raising an issue to a higher authority or different function because risk, urgency, or decision rights require it.	clarify escalation; document escalation	Contrast: escalation should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify escalation and the evidence that supports it.
owner	Named person or role accountable for a decision, action, deliverable, or risk.	clarify owner; document owner	Contrast: owner should be defined against the relevant evidence and decision boundary, rather than used as a vague label. Example: Before we proceed, please clarify owner and the evidence that supports it.

Industry-Specific Meeting Moves

Situation	Useful language
Production Flow and Daily Management	Before we commit, I want to confirm throughput, cycle time, the owner, and the evidence behind the decision. If the constraint may be material availability, changeover time, staffing, or equipment reliability., I recommend we document the risk and agree on the next step.
Lean, Waste, and Continuous Improvement	Before we commit, I want to confirm kaizen, standard work, the owner, and the evidence behind the decision. If process design, layout, standard work, and visual management need review., I recommend we document the risk and agree on the next step.
Defects, Scrap, and Rework	Before we commit, I want to confirm defect, scrap, the owner, and the evidence behind the decision. If containment, defect mode, inspection plan, and customer impact must be defined., I recommend we document the risk and agree on the next step.
Root Cause and Corrective Action	Before we commit, I want to confirm root cause, 5 Whys, the owner, and the evidence behind the decision. If root cause must be supported by data, not assumed from the visible failure., I recommend we document the risk and agree on the next step.
Maintenance, Reliability, and Changeover	Before we commit, I want to confirm preventive maintenance, MTBF, the owner, and the evidence behind the decision. If unplanned downtime, safety risk, spare parts, and preventive maintenance need balancing., I recommend we document the risk and agree on the next step.
EHS and Safety Communication	Before we commit, I want to confirm EHS, lockout/tagout, the owner, and the evidence behind the decision. If safety controls, lockout/tagout, and incident risk override schedule pressure., I recommend we document the risk and agree on the next step.
Supplier Quality and Incoming Materials	Before we commit, I want to confirm supplier quality, incoming inspection, the owner, and the evidence behind the decision. If specification, deviation approval, alternate supply, and customer risk must be assessed., I recommend we document the risk and agree on the next step.
Shift Handoffs and Escalation	Before we commit, I want to confirm handoff, andon, the owner, and the evidence behind the decision. If handoff needs status, actions taken, risk, owner, and escalation path., I recommend we document the risk and agree on the next step.

High-pressure pushback frames

- I understand the urgency. The risk is that we move faster than the evidence or process supports.
- I am not blocking the goal. I am naming the condition we need before the decision is safe and credible.
- If we accept this risk, we should name the owner, document the assumption, and define the trigger for escalation.
- That may be possible, but not under the current scope, timeline, or approval path.
- Let's separate what we know, what we assume, and what still needs confirmation.

Assessment and Coaching

Performance rubric

Skill	Developing	Proficient	Strong
Terminology	Recognizes terms but uses them loosely.	Uses field terms accurately in context.	Defines terms, connects them to evidence, and explains decision impact.
Pushback	Disagrees vaguely or avoids disagreement.	Names concern with evidence and next step.	Balances urgency, relationship, risk, owner, and decision rights.
Scenario judgment	Focuses on one stakeholder's preference.	Identifies constraint, risk, and process.	Guides the group toward a documented, realistic decision.
Decision communication	Selects language without linking it to the decision.	Chooses language that names facts, owner, and next step.	Distinguishes evidence, tradeoff, authority, and escalation in a decision-ready response.

Source orientation

- Company quality manuals and SOPs.
- OSHA or local safety requirements.
- Customer specifications and supplier quality agreements.
- The learner's own company policies, SOPs, contracts, systems, templates, and approved communication standards.
