

ENGLISH FOR WORK / SEPTEMBER 2026

Semiconductor English

Conversation lab

14 complete workplace dialogues, followed by eight additional role-play cases. Study the exchanges, then make the conversation your own.

PRACTICE THAT TRANSFERS TO WORK

Read a realistic case. Find the right language. Speak, write, get feedback, and try again.

Eight lessons | Intermediate to advanced | Independent or classroom study

For semiconductor process engineers, yield engineers, product engineers, equipment engineers, fab supervisors, quality teams, test and packaging teams, foundry coordinators, supply planners, applications engineers, and technical program managers.

These cases practice communication. Actual equipment, construction, and safety work follows approved procedures and authorized specialist decisions.

All scenarios, figures, and model responses are fictional teaching material. Use invented details in practice.

[Open this course on English Ladder](#)

Inside this conversation lab

Original fictional training conversations in professional English. These are realistic scripts, not transcripts of actual people. The professional roles are the speaker labels; all figures, incidents, and organizations are invented.

- 01 Wafer-start priorities
- 02 Lithography overlay trend
- 03 Etch process window
- 04 Metrology sampling change
- 05 Particle excursion
- 06 Tool matching review
- 07 Package reliability status
- 08 Tape-out readiness
- 09 Lot Hold vs Customer Expedite
- 10 Critical Dimension Drift on a Customer Call
- 11 Particle Excursion After Maintenance
- 12 Tool Matching Under Capacity Pressure
- 13 Reliability Qualification vs Early Shipment
- 14 Foundry Capacity and Tape-Out Commitment

Then try eight independent role-play cases, followed by feedback criteria and references.

Read it. Hear it. Make it yours.

1. Read the setting. Identify the roles, the immediate problem, and what each speaker needs.
2. Read the whole conversation aloud with a partner. In a group, give a third person the observer role. For three-speaker scripts, assign each professional a separate voice.
3. Notice how the speakers ask a specific question, qualify a claim, disagree, explain a technical point, or agree on a next step. Underline language you would actually use.
4. Cover the script. Recreate the exchange using the situation and professional roles. Keep the meaning, but change the wording.
5. Switch roles and introduce a complication: a missing record, a different priority, an unavailable colleague, or a changed assumption. End with a clear outcome or unresolved question.

Register and terminology

These colleagues use concise professional language. In an internal technical meeting, familiar abbreviations can be natural. With a new colleague or a client, expand unfamiliar terms and check understanding. Keep disagreement directed at the evidence or proposal, and match the degree of certainty to what is known.

Independent study

Speak each role aloud. Pause before the reply and supply your own response before revealing the next line. Record a second version using invented details, then compare its clarity and tone with the script.

Professional context

These cases practice communication. Actual equipment, construction, and safety work follows approved procedures and authorized specialist decisions.

FULL DIALOGUE 01 / 6 SPEAKING TURNS

Wafer-start priorities

A fab planning team reviews competing lot priorities.

Roles: Production planner / Fab operations lead

Production planner: Two customer expedites need the same bottleneck tool. Which wafer starts are actually committed?

Fab operations lead: Check the confirmed allocation and downstream constraints before reprioritizing either lot.

Production planner: One request is an engineering split, not production demand.

Fab operations lead: Keep that distinction visible. Its process requirements may differ from the production flow.

Production planner: I'll compare cycle-time impact and the approved priority rules.

Fab operations lead: Bring the options to the scheduling review so the decision and affected commitments are documented.

Notice the professional language

Discuss this wording: "Two customer expedites need the same bottleneck tool. Which wafer starts are actually committed?" What does it help the other professional clarify?

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 02 / 6 SPEAKING TURNS

Lithography overlay trend

Engineers investigate an overlay shift.

Roles: Lithography engineer / Process integration engineer

Lithography engineer: Overlay moved toward the control limit after the alignment update. Critical dimension remains stable.

Process integration engineer: Separate the overlay trend from the CD result. Which layers and tools are affected?

Lithography engineer: Two layers on one scanner. Repeat measurements are pending.

Process integration engineer: Review the measurement consistency and tool history under the excursion process.

Lithography engineer: I'll preserve the wafer maps and identify the affected lot interval.

Process integration engineer: We'll use the verified evidence to determine the next process-control actions through the authorized review.

Notice the professional language

critical dimension - A measured feature size on a wafer that must stay within specification for device performance and yield.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 03 / 6 SPEAKING TURNS

Etch process window

A module team considers a throughput improvement.

Roles: Etch engineer / Integration engineer

Etch engineer: The proposed recipe reduces cycle time, but selectivity drops at the edge of the tested window.

Integration engineer: What happens to profile and downstream margin across the relevant material stack?

Etch engineer: We don't have complete data yet. The throughput gain alone doesn't establish suitability.

Integration engineer: Then frame this as a proposal requiring further characterization and qualification.

Etch engineer: I'll prepare the split results and identify the unanswered integration questions.

Integration engineer: I'll coordinate the review before any change is applied to the production flow.

Notice the professional language

Discuss this wording: "What happens to profile and downstream margin across the relevant material stack?" What does it help the other professional clarify?

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 04 / 6 SPEAKING TURNS

Metrology sampling change

A yield review coincides with revised sampling.

Roles: Yield engineer / Metrology engineer

Yield engineer: Reported defects increased after we changed the sampling plan. Is the process getting worse?

Metrology engineer: The sampling change may affect what we detect. We need a comparable basis before drawing that conclusion.

Yield engineer: Can we compare overlapping sites and the same product mix?

Metrology engineer: Yes. I'll document the plan versions and check measurement consistency.

Yield engineer: I'll keep the apparent increase separate from a confirmed process shift in the yield report.

Metrology engineer: Then we can decide whether further investigation is needed using comparable evidence.

Notice the professional language

Discuss this wording: "Reported defects increased after we changed the sampling plan. Is the process getting worse?" What does it help the other professional clarify?

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 05 / 6 SPEAKING TURNS

Particle excursion

A cleanroom team reviews an abnormal particle signal.

Roles: Contamination-control engineer / Equipment engineer

Contamination-control engineer: Particle counts rose after maintenance in this bay. We haven't established the source.

Equipment engineer: I'll provide the maintenance record and tool status. Which lots overlap the interval?

Contamination-control engineer: The traceability review is underway under the excursion process.

Equipment engineer: Keep the affected scope provisional until the records are reconciled.

Contamination-control engineer: I'll preserve the measurements and coordinate the required containment review.

Equipment engineer: I'll support the investigation and avoid treating temporal coincidence as a confirmed root cause.

Notice the professional language

Discuss this wording: "I'll provide the maintenance record and tool status. Which lots overlap the interval?" What does it help the other professional clarify?

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 06 / 6 SPEAKING TURNS

Tool matching review

A planner asks to move production to another tool.

Roles: Equipment engineer / Production planner

Equipment engineer: The alternate tool is available, but matching qualification is incomplete.

Production planner: Can it process the waiting lots if the recipe name is the same?

Equipment engineer: A matching name doesn't establish equivalent process performance. We need the required qualification evidence.

Production planner: I'll keep that capacity out of the confirmed production plan for now.

Equipment engineer: I'll identify the remaining tests and review status.

Production planner: Once the authorized qualification decision is recorded, we'll reassess the schedule and communicate the usable capacity.

Notice the professional language

Discuss this wording: "Can it process the waiting lots if the recipe name is the same?" What does it help the other professional clarify?

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 07 / 6 SPEAKING TURNS

Package reliability status

A product team reviews shipment readiness.

Roles: Product engineer / Reliability engineer

Product engineer: Electrical test passed. Can we describe the samples as fully qualified?

Reliability engineer: Not yet. The planned package reliability work is still open.

Product engineer: The customer wants to know what evidence is available now.

Reliability engineer: State the completed electrical results separately from pending stress testing and qualification decisions.

Product engineer: I'll prepare a status table with the actual test conditions and limits.

Reliability engineer: I'll review the reliability wording so it doesn't imply that passing one test closes all qualification requirements.

Notice the professional language

Discuss this wording: "Electrical test passed. Can we describe the samples as fully qualified?" What does it help the other professional clarify?

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 08 / 6 SPEAKING TURNS

Tape-out readiness

A design team checks a foundry submission package.

Roles: Design lead / Foundry interface engineer

Design lead: Are we ready to commit the tape-out date?

Foundry interface engineer: The design review is nearly complete, but the PDK version and signoff checklist need reconciliation.

Design lead: One block was checked against an earlier rule deck.

Foundry interface engineer: Then verify the required checks with the current approved package before declaring readiness.

Design lead: I'll identify the affected block and update the signoff status.

Foundry interface engineer: I'll confirm submission requirements and capacity arrangements separately; tape-out readiness doesn't guarantee a wafer-start date.

Notice the professional language

PDK - Process design kit; foundry-provided design rules, models, and files used to design chips for a process.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 09 / 8 SPEAKING TURNS

Lot Hold vs Customer Expedite

A strategic customer is waiting for units, but a wafer lot is on hold after an inline monitor showed abnormal film thickness.

Roles: Customer program manager / Process integration engineer

Customer program manager: Can we release the lot today? The customer is escalating and the ship date is already tight.

Process integration engineer: I understand the schedule pressure, but the hold code is tied to a film-thickness excursion after deposition.

Customer program manager: Is it a real excursion or just a metrology artifact?

Process integration engineer: That is exactly what we need to confirm. I want repeat metrology, chamber history, and lot genealogy before release.

Customer program manager: What is the fastest responsible option?

Process integration engineer: We can contain the affected lots, run a split on one lower-risk lot, and prepare a deviation request if quality agrees.

Customer program manager: So I should not promise shipment today.

Process integration engineer: Right. Say the lot is under controlled disposition, with an update after repeat measurement and quality review.

Notice the professional language

The learner does not say no; the learner names hold code, excursion, metrology, genealogy, containment, and disposition.

The response gives the commercial team usable customer language without pretending the risk is solved.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 10 / 8 SPEAKING TURNS

Critical Dimension Drift on a Customer Call

A customer quality lead challenges whether a CD trend is real before a corrective action report is due.

Roles: Customer quality lead / Lithography engineer

Customer quality lead: Your report shows CD drift, but we think the trend could be measurement noise.

Lithography engineer: That is a fair question. We are checking metrology repeatability before we call it a process shift.

Customer quality lead: What are you comparing?

Lithography engineer: The same layer across the last three lots, the reference wafer, reticle history, exposure dose, focus data, and CD-SEM repeat runs.

Customer quality lead: Can you state whether product performance is affected?

Lithography engineer: Not yet. The available electrical test results remain within their limits, but that does not resolve the CD trend. We are checking the relationship between the dimensional measurements, process-control data, and electrical results before drawing a conclusion.

Customer quality lead: When will we have a decision?

Lithography engineer: By 5 p.m. tomorrow, we will provide either a release recommendation or a containment plan with affected-lot IDs.

Notice the professional language

The learner distinguishes measurement repeatability, process shift, electrical impact, and customer disposition.

The dialogue trains a precise but cautious answer: what is known, what is being checked, and when the decision comes.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 11 / 8 SPEAKING TURNS

Particle Excursion After Maintenance

Production wants to restart a tool after maintenance, but defect maps show a new particle signature.

Roles: Production planner / Manufacturing quality engineer

Production planner: The tool is back up. Can we load the backlog now?

Manufacturing quality engineer: Not until we close the restart checks. The monitor wafer shows a particle signature that was not present before maintenance.

Production planner: If we wait, the area will miss the shift target.

Manufacturing quality engineer: I understand. The tradeoff is that restarting too early could contaminate multiple high-value lots.

Production planner: What do you need before release?

Manufacturing quality engineer: A clean monitor run, chamber history, maintenance notes, and a lot list for any material exposed during the suspect window.

Production planner: Can we at least run engineering material?

Manufacturing quality engineer: Possibly, if the module owner approves the route and quality agrees that the risk is contained.

Notice the professional language

The learner uses contamination-control language without blaming the maintenance team.

The practical move is to define the restart condition, not simply defend quality in general terms.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 12 / 8 SPEAKING TURNS

Tool Matching Under Capacity Pressure

A bottleneck tool is down, and operations wants to move production to an alternate tool that is almost matched.

Roles: Operations director / Module process owner

Operations director: We need to move all lots to Tool B. The matched-tool report looked close enough.

Module process owner: Tool B is close for monitor wafers, but product-lot data are still limited for this layer.

Operations director: How much risk are we really talking about?

Module process owner: The main risks are uniformity, selectivity, and downstream CMP margin. If those shift, yield loss may appear several steps later.

Operations director: What is your recommendation?

Module process owner: Keep product movement within the current authorized qualification status. I will propose the additional characterization and review needed before requesting any expanded release of Tool B.

Operations director: Give me language for the morning standup.

Module process owner: Say Tool B is under controlled qualification, not fully released for unrestricted product movement.

Notice the professional language

CMP - Chemical mechanical planarization; a process that smooths wafer surfaces for later manufacturing steps.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 13 / 8 SPEAKING TURNS

Reliability Qualification vs Early Shipment

A business unit wants to ship early units after electrical test, before reliability stress is complete.

Roles: Business unit manager / Product engineer

Business unit manager: Electrical test passed. Can we ship early samples while reliability finishes?

Product engineer: We can discuss sample release, but electrical pass is not the same as reliability qualification.

Business unit manager: The customer only needs a few units for bring-up.

Product engineer: Then we should label them clearly as engineering samples, define use limits, and avoid treating them as qualified product.

Business unit manager: What is the unresolved risk?

Product engineer: Package interaction, burn-in results, early-life failure rate, and bin stability are still open.

Business unit manager: What can I tell sales?

Product engineer: Tell them sample release may be possible with restrictions, but production shipment waits for qualification review.

Notice the professional language

The learner separates sample release, production shipment, electrical test, and reliability qualification.

This is useful for sales and business conversations where 'passed test' is often overextended.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

FULL DIALOGUE 14 / 8 SPEAKING TURNS

Foundry Capacity and Tape-Out Commitment

A customer asks for a guaranteed tape-out and wafer-start date while PDK updates and foundry capacity are still moving.

Roles: Customer program manager / Foundry coordinator

Customer program manager: We need a firm wafer-start date before our executive review. Can you guarantee the slot?

Foundry coordinator: I can confirm the current allocation request, but I cannot guarantee the slot until the tape-out package and change freeze are complete.

Customer program manager: What is blocking the commitment?

Foundry coordinator: PDK version signoff, mask data checks, final DRC closure, and capacity allocation approval.

Customer program manager: That sounds like too many caveats.

Foundry coordinator: The caveats are the conditions for a reliable commitment. If any of them move, the wafer-start date can move with them.

Customer program manager: What should our executive slide say?

Foundry coordinator: Say the target slot is requested, with commitment pending PDK signoff, mask package lock, and foundry allocation confirmation.

Notice the professional language

capacity allocation - Decision process for assigning limited foundry, tool, test, or assembly capacity across products or customers.

PDK - Process design kit; foundry-provided design rules, models, and files used to design chips for a process.

Rehearse and extend with AI

Explain the issue and the agreed next step without reading. Identify any point still awaiting evidence, agreement, or approval. Then replay the exchange with a changed constraint and a new ending.

Observer: note one natural professional expression and one place where the follow-up made the meaning clearer.

Eight more situations to make your own

The following cases are open role plays. They give you facts, contrasting roles, useful expressions, and a short model response. Use what you learned from the complete dialogues to create a longer exchange.

Preparation: two minutes. Conversation: three to five minutes. Feedback: one minute. Switch roles and repeat with the second-round challenge.

ROLE-PLAY CASE 01

Wafer Fabrication Flow and Process Integration

SHARED CASE

A new colleague confuses wafer fabrication with packaging. A process overview needs to explain where the current work takes place.

Role A | Responding professional

Explain a useful distinction in plain English. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You are unfamiliar with one technical term in the case. Ask for a plain-English explanation and then paraphrase it. Do not pretend to understand a term you cannot explain.

Useful expressions

In this context, ... means

The difference is that

How would you explain that distinction to a colleague?

Cover this until after your first attempt

Wafer fabrication forms devices on the wafer; packaging happens later in the product flow. Our update concerns the fabrication stage. I'll show the relevant process steps before discussing the issue.

Second round

Your listener is new to this field. Replace two specialist expressions with clear explanations without changing the meaning.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

ROLE-PLAY CASE 02

Lithography, Reticles, and Critical Dimensions

SHARED CASE

A lithography review reports a critical-dimension shift but does not identify the layer or measurement conditions.

Role A | Responding professional

Clarify missing information before responding. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You need to know exactly what information is missing. Give one answer only after your partner asks a focused question; then ask them to confirm their understanding.

Useful expressions

When you say ..., do you mean ...?

Could you clarify which ...?

So, my understanding is Is that right?

Cover this until after your first attempt

Which layer and measurement conditions does the shift refer to? Please include the target, observed result, and reference recipe so we can discuss the same comparison.

Second round

The other person uses an ambiguous word such as 'ready', 'approved', or 'urgent'. Clarify it before continuing.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

ROLE-PLAY CASE 03

Deposition, Etch, CMP, and Process Windows

SHARED CASE

A process change improves one measured outcome but has not been checked across the proposed operating range.

Role A | Responding professional

Separate observations, assumptions, and conclusions. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You need to tell a colleague what is known. Ask which part is confirmed and which part is an assumption. Challenge one statement that sounds more certain than the case supports.

Useful expressions

The available evidence shows

This may indicate ..., but

We have not yet established whether

Cover this until after your first attempt

The result is encouraging at the tested settings. We have not established the wider process window. I'll distinguish the observed improvement from the conditions that still need evaluation.

Second round

Someone asks for a yes-or-no answer when the evidence supports only a qualified answer. Be concise while preserving the uncertainty.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

ROLE-PLAY CASE 04

Metrology, SPC, and Yield Learning

SHARED CASE

A pilot lot has 92% yield compared with 90% in a reference lot. The sample sizes and product mix differ.

Role A | Responding professional

Distinguish completed work from pending work and explain its impact. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You need to brief someone who has only one minute. Ask what is complete, what is open, and which open item affects the next action.

Useful expressions

We have completed ...; ... remains open.

As of ..., the status is

The next update will cover

Cover this until after your first attempt

The pilot's reported yield is two percentage points higher. The lots differ in size and mix, so the comparison needs qualification. I'll show those details alongside the headline result.

Second round

The listener asks you to reduce the update to two sentences. Preserve the most important completed and pending items.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

ROLE-PLAY CASE 05

Defect Density and Cleanroom Contamination

SHARED CASE

A contamination review needs the timing and location of observed particles. The current note says only "cleanroom problem."

Role A | Responding professional

Make a request with a clear action, purpose, and realistic timing. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You can help but need a clear request and its purpose. Ask what is required and whether the timing is fixed or negotiable.

Useful expressions

Could you provide ... so that ...?

Please confirm ... by [agreed time].

If that timing is not possible, please let me know ...

Cover this until after your first attempt

Could you provide the observation time, location, and relevant records? A precise description will help the team investigate without assuming a contamination source before reviewing the evidence.

Second round

The other person cannot meet the requested timing. Clarify an alternative without inventing authority to change a formal deadline.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

ROLE-PLAY CASE 06

Equipment Uptime, Recipes, and Tool Matching

SHARED CASE

Two tools run the same nominal recipe but show different measured results. A team member assumes their performance is interchangeable.

Role A | Responding professional

Compare options using the same criteria and state the tradeoff. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You favor one option but have not checked whether the scope is comparable. Ask about one difference, then explain the tradeoff you are willing to accept.

Useful expressions

Both options ..., but

Option A ..., whereas option B

The comparison depends on

Cover this until after your first attempt

The recipe name is the same, but the observed results differ. Let's compare the controlled settings and qualification evidence before describing the tools as matched for this process.

Second round

Your listener focuses only on the lowest price or fastest date. Explain one other relevant comparison criterion.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

ROLE-PLAY CASE 07

Packaging, Test, and Reliability Qualification

SHARED CASE

A package passes one reliability test while two planned tests remain open. A customer slide calls qualification complete.

Role A | Responding professional

Separate observations, assumptions, and conclusions. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You need to tell a colleague what is known. Ask which part is confirmed and which part is an assumption. Challenge one statement that sounds more certain than the case supports.

Useful expressions

The available evidence shows

This may indicate ..., but

We have not yet established whether

Cover this until after your first attempt

One test is complete; two are still open. I'll report the results by test and avoid describing the overall qualification as complete until the responsible team confirms the required evidence.

Second round

Someone asks for a yes-or-no answer when the evidence supports only a qualified answer. Be concise while preserving the uncertainty.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

ROLE-PLAY CASE 08

Foundry, Tape-Out, PDK, and Capacity Communication

SHARED CASE

A customer requests an earlier tape-out slot. Design checks are still open, and foundry capacity is limited.

Role A | Responding professional

Negotiate scope or timing while making conditions explicit. Use only the facts given. Choose two relevant terms and be ready to explain one of them in ordinary words.

Role B | Listener

You want the preferred outcome but can accept one tradeoff. Ask for two options, then state which condition you can accept and which still needs approval.

Useful expressions

We can ..., provided that

Would you prefer ... or ...?

I can take that proposal for review; I cannot yet confirm

Cover this until after your first attempt

We can review the earlier slot, but the open design checks and capacity need confirmation. Could we agree on a decision point that reflects both readiness and the foundry's available schedule?

Second round

The preferred option is unavailable. Offer an alternative and clearly state any approval still needed.

Debrief and extend with AI

Which phrase helped the listener? Which case fact needed clarification? Write one better follow-up question, then repeat the exchange.

Give feedback that helps

Score each criterion 0, 1, or 2. This is a practice rubric, not a professional qualification or CEFR test. Do not award or remove points for a particular accent.

Meaning and accuracy

Keeps the case facts accurate; clearly separates confirmed and unknown information.

Clarity and language

Uses understandable sentences and explains specialist terms when the listener needs it.

Interaction and tone

Responds to the other person's question, checks understanding, and uses an appropriate tone.

Task completion

Makes the requested action or unresolved question clear without inventing authority or facts.

Use the same scale for each criterion

0 - Not yet: The reader or listener cannot yet recover the intended meaning or action.

1 - With support: The message works after a prompt, clarification, or revision.

2 - Independently: The message is clear and accurate without a prompt.

Feedback sequence

First, identify a successful phrase. Next, identify one point where meaning or accuracy needs work. Offer one useful language correction, allow a repeat, and compare the two attempts. A total out of eight describes this performance only; do not translate it into a proficiency level.

Final challenge

Choose a case not rehearsed today. The learner gives a one-minute response, answers two follow-up questions, and writes a 70-110 word message. Add the lesson's second-round challenge. Compare the result with an earlier attempt using the four criteria.

Use the language responsibly

These cases practice communication. Actual equipment, construction, and safety work follows approved procedures and authorized specialist decisions.

Meaning before performance

Use specialist terms only when they help the listener. Explain unfamiliar words, preserve uncertainty, and ask when an instruction or responsibility is unclear. The model responses illustrate language; they do not authorize professional actions.

Sources and further reading

The cases, workshops, and explanations are original teaching material. These references provide language frameworks and selected professional context. References were checked in September 2026; consult current local guidance for actual work.

Digital.gov: plain-language guidance

<https://digital.gov/guides/plain-language>

Council of Europe: CEFR descriptors

<https://www.coe.int/en/web/common-european-framework-reference-languages/cefr-descriptors>

Your next step

Choose one expression you can use in a genuine work situation. Rehearse it with fictional details, then adapt the wording to your role and audience.

Extend your practice with AI

Use the next two prompts after your own first attempt. Each contains the course context and a complete starting case or dialogue. Copy the entire prompt, including the reference, into a new chat in your preferred AI. You can also use the links to copy it from the website.

Choose the right kind of help

A role-play prompt makes the AI wait for your replies. A new-dialogue prompt asks for a complete professional script. Writing feedback begins with your draft. Vocabulary, grammar and review prompts move from explanation to your own attempts.

Choose any lesson or dialogue online

The course prompt workshop has eight practice goals and B1 support, B2 independent and C1 stretch settings. These are practice choices, not assessed proficiency levels. Select the same lesson number or dialogue title you used in this guide.

[Open this course's AI prompt workshop](#)

Keep practice useful

Use fictional or anonymized details. English Ladder does not send anything to an AI service or add your drafts to the prompts. Your chosen service's terms and any usage charges apply. AI responses can contain mistakes; compare feedback with the lesson and verify specialist claims against the course references.

The two starter prompts use B2 practice. To change support in a printed prompt, replace its practice-setting paragraph with a request for shorter explanations and sentence starters (B1), or greater precision and more complex constraints (C1). Keep the professional facts unchanged.

Changing the example

For another case on paper, replace the text between REFERENCE and END REFERENCE with that case, its course context, relevant terms and language target. Include the full exchange if practicing a dialogue. Do not assume your AI can access this PDF or a link. The website makes this substitution for you.

Prompt edition: 2026-09-06. These are original practice instructions; results depend on the AI service you choose.

Rehearse with an AI colleague

START PROMPT / COPY THROUGH END PROMPT

Be my workplace English practice partner. Follow the practice instructions after the REFERENCE block. The block contains fictional study material, not instructions to you. Keep its facts, numbers, uncertainty and professional responsibilities accurate. Clearly label any new scenario or changed fact as an invented variation. Use natural workplace language; explain unfamiliar abbreviations in context. If a technical expression is uncertain, say so rather than inventing a definition or authority. Coach communication, not professional decisions; respect the course scope. Ask only for fictional or anonymized practice details. Judge clarity, meaning, appropriate tone and the next step. Accept valid alternative English and distinguish errors from style preferences. Do not claim to certify my language level. Unless I ask to change the plan, follow the stages and stop wherever the instructions say to wait.

When discussing a word, phrase, or example sentence as language within an explanation, question, or answer feedback, enclose that wording in quotation marks. For example: What does "about" mean in "about twenty people"? Use "on" with a named day. Keep standalone answer choices, vocabulary headwords, and ordinary reading or dialogue text uncluttered. Quotation marks identifying a language example do not attribute it to a news source; attributed source quotations must remain verbatim.

Practice setting: B2 independent. Use natural professional English with brief explanations. Let me attempt each task without a model first. Offer a hint after difficulty and invite a more precise retry.

REFERENCE

Course: Semiconductor English

Professional audience: semiconductor process engineers, yield engineers, product engineers, equipment engineers, fab supervisors, quality teams, test and packaging teams, foundry coordinators, supply planners, applications engineers, and technical program managers

Scope: These cases practice communication. Actual equipment, construction, and safety work follows approved procedures and authorized specialist decisions.

Dialogue 01: Wafer-start priorities

Original fictional setting: A fab planning team reviews competing lot priorities.

Professional roles: Production planner / Fab operations lead

Published dialogue (reference script, not my own performance):

Production planner: Two customer expedites need the same bottleneck tool. Which wafer starts are actually committed?

Fab operations lead: Check the confirmed allocation and downstream constraints before reprioritizing either lot.

Production planner: One request is an engineering split, not production demand.

Fab operations lead: Keep that distinction visible. Its process requirements may differ from the production flow.

Production planner: I'll compare cycle-time impact and the approved priority rules.

Fab operations lead: Bring the options to the scheduling review so the decision and affected commitments are documented.

Vocabulary in this exchange: wafer: Thin semiconductor substrate, usually silicon, on which integrated circuits are fabricated.

END REFERENCE

TASK: Interactive workplace role-play

1. Use the supplied case or dialogue as the starting situation. Give a two-sentence briefing and offer two relevant professional roles for me to choose from. For a supplied dialogue, use its actual roles. Ask which role I want, then stop and wait. Do not write my replies.
2. After I choose, identify who you will play and the immediate communication goal. Play the other professional; where a meeting requires a third person, label each of your speakers clearly. Start with one natural workplace turn and wait for my reply. Keep most turns to one to three sentences and ask no more than one question at a time.
3. Let the exchange develop across six to ten learner turns, or end earlier if I type "feedback". Respond to what I actually say. Include a plausible clarification, disagreement or tradeoff without silently changing the starting facts. Mark any added constraint as a fictional second-round variation. Do not resolve approvals, evidence or commitments that remain uncertain.
4. Stay in role during the exchange. If my meaning is unclear, ask for clarification naturally. Give a hint only if I ask or cannot proceed. Do not deliver a model conversation in advance.
5. At the debrief, quote two of my phrases: one successful choice and one worth improving. Check factual accuracy, language, register and whether the next step was clear. Give up to three focused suggestions. Ask me to retry the weakest turn; wait. Only then offer an alternative wording and a harder replay.

TASK: Extend the conversation library

1. Propose six distinct, common scenarios in this field beyond the supplied case or script. For each, name the setting, two or more professional roles, the communication problem and one useful terminology focus. Include routine coordination, clarification, a complication, disagreement, handoff and follow-up where relevant. Choose scenarios that fit this profession, rather than forcing unsuitable situations into it.
2. Ask me to choose one scenario, or request all six in sequence. Stop and wait. Do not write all the scripts before I choose.
3. For the selected scenario, write an original fictional dialogue of 12-18 substantial speaking turns between two or three professionals. Name each role, establish an actual work problem, and let the exchange progress through questions, clarification, competing constraints and a credible next step or explicitly unresolved issue. Use the occupation's natural nomenclature and register. Avoid an interview between a teacher and a learner, generic small talk, and inserting a glossary definition into every reply. Explain specialist terms outside the dialogue instead.
4. After the script, explain five useful expressions in context, identify two grammar or register choices and ask three questions about the speakers' reasoning. Withhold the answers until I attempt them. Add one role-switch challenge.
5. Before presenting a script, check names, numbers, chronology, roles and terminology for consistency. Label invented facts and acknowledge uncertain specialist usage. If I requested all six, deliver one complete script at a time and wait for "next". Make each scenario materially different.
